Develop a program to print the Mail exchange servers of a particular domain with their preferences.

A MX record also called mail exchanger record is a resource record in the Domain Name System that specifies a mail server responsible for accepting email messages on behalf of a recipient's domain.

▼ 1.importing required moudles
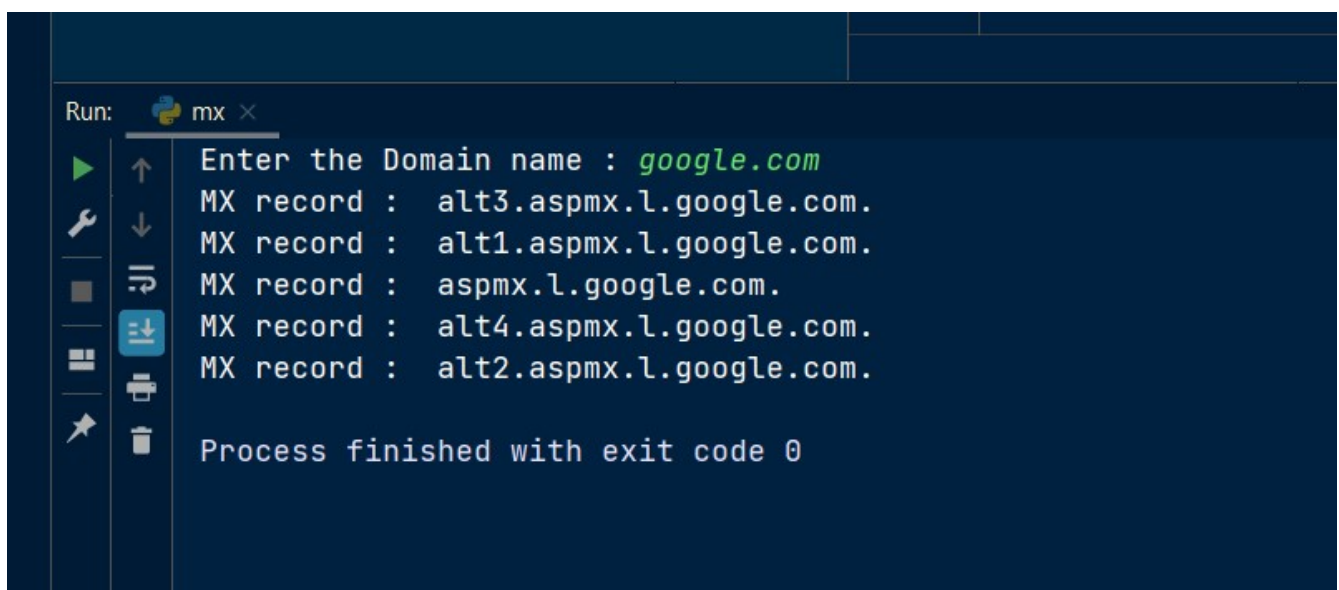

```
import dns.resolver
```

▼ 2. taking input

```
domain = input('Enter the Domain name : ')
```

▼ 3.printing accordingly

```
for record in dns.resolver.resolve(domain, 'MX'):
    print('MX record : ', (record.to_text()).split(' ', 1)[1])
```

output

```
Run:      mx  ×
  ▶    ↑      Enter the Domain name : google.com
              MX record :   alt3.aspmx.l.google.com.
  🔧    ↓      MX record :   alt1.aspmx.l.google.com.
  ■    ⇥      MX record :   aspmx.l.google.com.
       ⇟      MX record :   alt4.aspmx.l.google.com.
  💻          MX record :   alt2.aspmx.l.google.com.
  📌    🗑
              Process finished with exit code 0
